Story of success

Small cutting line for oak long logs

Delivery with log crosscut saw, waste handling system and guillotine. Capacity: 30,000 m³/ year.

Cutting line for stave wood out of oak logs

Follow-up order from group Charlois

After the successful installation of the system at Nièvre Merrain in Varcy in 2016 Holtec got the next order from Les Ateliers du Chêne – former Malviche.

Les Ateliers du Chêne is part of the Charlois group which is managed in third generation by Sylvain Charlois.

As Nièvre Merrain, Les Ateliers du Chêne is specialised in the production of staves. Holtec delivered a cutting line for staves for an annual production of approximately 30,000 m³ oak wood in one shift.

It is a small cutting line where the logs are loaded one after another onto a cross conveyor.

The latter feeds the cutting line. The operator of the line divides, marks and finally cuts the expensive high quality oak logs on the infeed conveyor to the saw. Behind the tried and tested Holtec tilting saw there is a sorting conveyor which forwards the cut logs to the different cranes of the splitting machine. Furthermore Holtec supplied the waste handling system for the splitting machines as well as for the band resaws. A guillotine to shred the rest wood follows on the waste handling system.
